6.3. **Pick's theorem.** Pick's theorem states that the area, A, of a polygon with lattice coordinates for its corners is given by

$$A = I + \frac{B}{2} - 1,$$

where B is the number of boundary lattice points and I is the number of interior lattice points. This can often be used to find the number of interior points of a polygon since the area is easily computed, see 6.1, and the number of boundary lattice points is calculated as follows:

1.1.1

Calculates the number of lattice boundary points of the polygon given by pts (including the points in pts). pts has to be sorted either in clockwise or counter clockwise order.

```
Time Complexity: O(n\log n), where n = len(pts).
Space Complexity: O(n)
def qcd(a,b):
    if a < b: return gcd(a,b)</pre>
    if b == 0: return a
    return gcd(b,a%b)
def boundarypoints(pts):
    n = len(pts)
    out = 0
    for i in range(-1, n-1):
        dx = abs(pts[i][0]-pts[i+1][0])
        dy = abs(pts[i][1]-pts[i+1][1])
        out += gcd(dx, dy)
    return out
6.4. Convex Hull.
111
Returns the convex hull in counter-clockwise order of the points
in pts. A point is represented by (x,y).
Time Complexity: O(nlogn), n is the number of points.
Space Complexity: O(n)
def ccw(p1,p2,p3):
```

```
return (p2[0]-p1[0])*(p3[1]-p1[1])-(p2[1]-p1[1])*(p3[0]-p1[0])
#Returns hull in counter-clockwise order.
\#pts is a list of tuples, each tuple is (x,y).
def hull(pts):
   n = len(pts)
    pts.sort()
   I = I
   L = []
    for i in range(n):
        while len(L)>1 and ccw(L[-2],L[-1],pts[i]) <= 0: L.pop()
        L.append(pts[i])
    for i in range(n-1,-1,-1):
        while len(U)>1 and ccw(U[-2],U[-1],pts[i]) <= 0: U.pop()
        U.append(pts[i])
   L.pop()
   U.pop()
   if len(L) == len(U) == 1 and L[0] == U[0]: return L
    return L+U

```

#### 9. Methods and ideas

Use some characteristics of the problem (i.e. bounds)

- N < 10: Exhaustive search N!
- $N \leq 20$ : Exponential, bitmask-DP?
- $-N < 10^4$ : Quadratic
- $-N \le 10^6$ : Has to be NlogN

## Greedy

- Invariants
- Scheduling

# BFS/DFS

DP

- Bitmask
- Recursively, storing answers

# Binary search

- Over the answer
- To find something in sorted structure

#### Flow

- Min-cost-max-flow
- Run the flow and look at min cut
- Regular flow
- Matching

View the problem as a graph

Color the graph

When there is an obvious TLE solution

- Use some sorted data structure
- In DP, drop one parameter and recover from others
- Is something bounded by the statement?
- In DP, use FFT to reduce one N to logN

Divide and conquer - find interesting points in NlogN

## Square-root tricks

- Periodic rebuilding: every  $\sqrt{n}$ , rebuild static structure.
- Range queries: split array into segments, store something for each segment.
- Small and large: do something for small(with low degree) nodes and something else for large nodes.
- If the sum of some parameters is small, then the number of different sized parameters is bounded by roughly  $\sqrt{n}$ .

# Hall's marriage theorem

Combinatorics / Number theory / Maths

- Inclusion/Exclusion
- Fermat's little theorem / Euler's theorem
- NIM

### Randomization

- Finding if 3 points are on the same line
- Checking matrix equality by randomizing vector and multiply

## Geometry

- Cross product to check order of points / area
- Scalar product

### 10. Practice Contest Checklist

- Operations per second in py2
- Operations per second in py3
- Operations per second in java
- Operations per second in c++
- Operations per second on local machine
- Is MLE called MLE or RTE?
- What happens if extra output is added? What about one extra new line or space?
- Look at documentation on judge.
- Submit a clar.
- Print a file.
- Directory with test cases.
- Check how to change keyboard layout (english, swedish)
- Check that bash script works
