2. Templates, etc.	2		
2.1.  C++	2		
2.2. Python	2		
2.3. Bash	2	1. Achieving AC on solved problems	
3. Data Structures	2	1. ACHIEVING AC ON SOLVED PROBLEMS	
3.1. Fenwick Tree	2	1.1. <b>WA.</b>	
3.2. Segment Tree	3	• Edge cases (minimal input, etc)?	
3.3. Lazy Setting Segment Tree	4	<ul><li>Does test input pass?</li></ul>	
3.4. Lazy Incrementing Segment Tree	5		
3.5. Union Find	6	• Is overflow possible?	
3.6. Monotone Queue	6	• Is it possible that we solved the wrong problem? Reread the p	roblem state-
3.7. Treap	6	ment!	
4. Graph Algorithms	8	• Start creating small test cases.	
4.1. Distance from source to all nodes (pos weights) - Djikstra's algorithm	8	• Does cout print with sufficient percision?	
4.2. Distance from source to all nodes (neg weights) - Bellman Ford	8	• Abstract the implementation!	
4.3. All distances in graph (neg weights) - Floyd Warshall	10		
4.4. Bipartite graphs	10	1.2. <b>TLE.</b>	
4.5. Network flow	11	• Is the solution sanity checked? (Time complexitity)	
4.6. Min cost max flow	14	• Use pypy / rewrite in C++ and Java	
4.7. Topological sorting - for example finding DAG order	16	• Can DP be applied in some part?	
4.8. 2sat	16	<ul> <li>Try creating worst case input to see how far away the solution i</li> </ul>	ia
5. Dynamic Programming	17		.5
5.1. Longest increasing subsequence	17	Binary search instead of exhaustive search	
5.2. String functions	18	• Binary search over the answer	
5.3. Josephus problem	18	1.3. <b>RTE.</b>	
5.4. Knapsack	18		
6. Coordinate Geometry	18	• Recursion limit in python?	
6.1. Area of polygon	18	• Out of bounds?	
6.2. General geometry operations on lines, segments and points	19	• Division by 0?	
6.3. Pick's theorem	20	• Modifying something we iterate over?	
6.4. Convex Hull	20	• Not using well defined sorting?	
7. Math	21	• If nothing makes sense, try binary search with try-catch/except	

```
1.4. MLE.
    • Create objects outside recursive function
    • Rewrite recursive solution to iterative
                           2. Templates, etc.
2.1. C++.
#include <bits/stdc++.h>

6.3. **Pick's theorem.** Pick's theorem states that the area, A, of a polygon with lattice coordinates for its corners is given by

$$A = I + \frac{B}{2} - 1,$$

where B is the number of boundary lattice points and I is the number of interior lattice points. This can often be used to find the number of interior points of a polygon since the area is easily computed, see 6.1, and the number of boundary lattice points is calculated as follows:

 $\mathbf{r}_{-1}, \mathbf{r}_{-1}$ 

Calculates the number of lattice boundary points of the polygon given by pts (including the points in pts). pts has to be sorted either in clockwise or counter clockwise order.

Time Complexity: O(nloan), where n = len(pts).

```
Space Complexity: O(n)
def qcd(a,b):
    if a < b: return gcd(a,b)</pre>
    if b == 0: return a
    return qcd(b,a%b)

                                                                                 vector<pair<ll,ll> > jobs;
    • 120586241 = 2^{20} \cdot 5 \cdot 23 + 1
                                                                                 for(int i = 0; i < n; i++){
     • 998244353 = 2^{23} \cdot 7 \cdot 17 + 1
                                                                                      ll s,t; cin >> s >> t; jobs.push_back({s,t});
8.3. Scheduling.
                                                                                  cout << schedule(jobs,k) << endl;</pre>
#include <bits/stdc++.h>
using namespace std;
typedef long long ll;
bool comp(pair<ll, ll> p1, pair<ll, ll> p2){
    if(p1.second != p2.second) return p1.second < p2.second;</pre>
    return p1.first < p2.first;</pre>
}
```

#### 9. Methods and ideas

Use some characteristics of the problem (i.e. bounds)

- N < 10: Exhaustive search N!
- $N \leq 20$ : Exponential, bitmask-DP?
- $-N < 10^4$ : Quadratic
- $-N \le 10^6$ : Has to be NlogN

## Greedy

- Invariants
- Scheduling

# BFS/DFS

DP

- Bitmask
- Recursively, storing answers

# Binary search

- Over the answer
- To find something in sorted structure

#### Flow

- Min-cost-max-flow
- Run the flow and look at min cut
- Regular flow
- Matching

View the problem as a graph

Color the graph

When there is an obvious TLE solution

- Use some sorted data structure
- In DP, drop one parameter and recover from others
- Is something bounded by the statement?
- In DP, use FFT to reduce one N to logN

Divide and conquer - find interesting points in NlogN

## Square-root tricks

- Periodic rebuilding: every  $\sqrt{n}$ , rebuild static structure.
- Range queries: split array into segments, store something for each segment.
- Small and large: do something for small(with low degree) nodes and something else for large nodes.
- If the sum of some parameters is small, then the number of different sized parameters is bounded by roughly  $\sqrt{n}$ .

# Hall's marriage theorem

Combinatorics / Number theory / Maths

- Inclusion/Exclusion
- Fermat's little theorem / Euler's theorem
- NIM

### Randomization

- Finding if 3 points are on the same line
- Checking matrix equality by randomizing vector and multiply

## Geometry

- Cross product to check order of points / area
- Scalar product

### 10. Practice Contest Checklist

- Operations per second in py2
- Operations per second in py3
- Operations per second in java
- Operations per second in c++
- Operations per second on local machine
- Is MLE called MLE or RTE?
- What happens if extra output is added? What about one extra new line or space?
- Look at documentation on judge.
- Submit a clar.
- Print a file.
- Directory with test cases.
- Check how to change keyboard layout (english, swedish)
- Check that bash script works
